1. Difference between Web-Safe Fonts and Custom Fonts

- **Web-Safe Fonts**: Pre-installed on most devices, ensuring consistency across browsers (e.g., Arial, Times New Roman).

- **Custom Fonts**: Require external files (e.g., Google Fonts), providing unique typography but needing additional loading time.

2. What is font-family in CSS?

The **font-family** property specifies the typeface for text. It includes a list of fonts, where the browser selects the first available one.

Example:

```css
body {

  font-family: Arial, sans-serif;

}
```

3. How to Apply a Google Font?

Import via <link> in HTML:

```html
<link
href="https://fonts.googleapis.com/css2?family=Roboto&display=swap"
rel="stylesheet">
```

Use in CSS:

```css
body {

  font-family: 'Roboto', sans-serif;

}
```
